Public version: employer, client and internal system names are generalized; sensitive implementation details are omitted.

01

CONTENTS

23 Projects Summarized as 9 Work Showcases

Every project is represented through its delivered business capability

Related projects are grouped by the business capability they delivered. This keeps the public version concise while ensuring every project is represented.

NO.	SHOWCASE	PROJECTS	WHAT IT SHOWS
01	Content Storage and Lifecycle	3	Storage adapters, movement jobs and transparent compression
02	Document Security and Access Governance	3	Document protection, authorization and upload governance
03	Audit and Operational Observability	2	Audit investigation, service metrics and dashboards
04	Document Operations and Digital Capture	4	Bulk administration, PDF processing, scanning and OCR
05	Permission-Aware AI Repository Assistant	1	AI integration with authenticated repository context
06	External Portal and Workflow Access	1	Partner portal, account boundary and workflow access
07	Digital Onboarding and Customer Consent	4	Onboarding orchestration, consent and technical leadership
08	Reconciliation and Settlement Processing	2	Secure file batches, reconciliation and settlement
09	Enterprise Modernization and Delivery Leadership	3	Requirements-to-production modernization and integration

READING GUIDE Each following page answers four questions: What was needed? What did I build? What did I own? How did it help?

02

PROFILE

What I Bring to Enterprise Delivery

Backend engineering, system analysis and integration delivery

ABOUT MY WORK

I work at the point where business requirements, backend services and enterprise platforms meet. My strongest contribution is turning an unclear process into a system flow, implementation plan and supportable production solution.

PRIMARY VALUE Backend engineering, enterprise integration and system analysis supported by hands-on technical delivery.

DELIVERY RANGE Requirements and flows → architecture decisions → implementation and review → testing, release and production support.

SUPPORTING UI Alfresco Share components, menus, forms and Bootstrap/JavaScript administration interfaces around backend capabilities.

Capability areas

MODERN BACKEND Java, Spring Boot, REST APIs, Kafka, Redis, SQL/NoSQL and secure batch processing	ENTERPRISE INTEGRATION Workflow, ECM, banking/partner services, cloud storage and file-based integration
SYSTEM ANALYSIS Requirements, process flow, service boundaries, error behavior and technical decisions	SECURITY & GOVERNANCE Trusted identity, authorization, permissions, encryption, audit and controlled data handling
OPERATIONS Job control, metrics, reporting, troubleshooting, runbooks and production readiness	TECHNICAL LEADERSHIP Design discussion, code review, task decomposition and cross-team coordination

How this differs from the interview portfolio

This showcase emphasizes delivered work and outcomes. The separate Technical Interview Portfolio retains the detailed system flows, design decisions and UML needed for architecture or engineering discussion.

01

ENTERPRISE CONTENT PLATFORMS

Content Storage and Lifecycle

Made enterprise content storage configurable, movable and ready for cloud or compressed storage without changing the user workflow.

MY ROLE	DELIVERY SCOPE	TECH HIGHLIGHTS
System Analyst / Technical Lead / Java Developer	Backend services, scheduled operations and admin UI	Java, ContentStore API, Cloud Object Storage, Quartz, LZ4

WHY IT MATTERED Give operations teams controlled ways to place, move and retrieve repository content across different storage strategies.

01 Content Storage and Lifecycle

Configurable content placement, scheduled movement and transparent storage optimization

Legend: blue = application component, teal = service, purple dashed = external system, green = data store amber = event or file channel

High-level architecture overview - Content Storage and Lifecycle.

WHAT I DELIVERED

- Built configurable content-store selection and safe movement between managed storage locations.
- Added manual and scheduled jobs with validation, status, cooperative stop and auditable outcomes.
- Implemented a cloud object-storage connector with stable content references and a managed local cache.
- Implemented transparent LZ4 compression/decompression for selected repository content.

HOW IT HELPED

- Turned storage changes into a repeatable operational process instead of a one-off migration script.
- Kept document access consistent while physical storage strategies changed behind the repository boundary.
- Created reusable storage patterns that translate to modern object-storage and lifecycle services.

3 projects represented: Content Store Selector, Cloud Storage Connector and Compressed Content Store.

MODERN TRANSLATION Pluggable object-storage adapters, scheduled workers, lifecycle policies and transparent storage optimization.

01

SELECTED WORK SCREENS

Content Storage Operations

Selected views of scheduling, destination selection and storage optimization.

WHAT THIS SHOWS These screens show how administrators and authorized users control content placement, movement schedules and compression without changing normal repository access.

SELECTED WORK SCREENS

Schedule	Target Storage	Enabled	Status	Last Results	Last Run	Next Run	Actions
10 00:11:17 - Asia/Bangkok	default	☒	ON	Matched 0, moved 0, skipped 0, failed 0	Never	Disabled	Edit Enable Start Now Stop Now Delete
Test 00:11:17 - Asia/Bangkok	default	☒	ON	Matched 0, moved 0, skipped 0, failed 0	Never	Disabled	Edit Enable Start Now Stop Now Delete
Test 00:11:17 - Asia/Bangkok	default	☒	ON	Matched 0, moved 0, skipped 0, failed 0	Never	Disabled	Edit Enable Start Now Stop Now Delete
Every 5 Minutes 01:05:11 - Asia/Bangkok	default	☒	ON	Matched 1, moved 1, skipped 0, failed 0	8/14/2025, 6:19:54 PM	Not scheduled	Edit Disable Start Now Stop Now Delete

If errors occur run script:

Select...

Compression rule configuration

Additional public work screens - Content Storage Operations.

These views supplement the preceding capability summary and show distinct parts of the delivered user experience.

01

SELECTED WORK SCREENS

Content Storage Scheduling and Selection

Additional views of reusable schedules and the user-facing storage action.

WHAT THIS SHOWS The administration view separates reusable Quartz schedules from movement jobs, while the repository action gives authorized users a controlled storage-selection entry point.

SELECTED WORK SCREENS

Content Store Selector Cron Management

Create and manage reusable Quartz schedules. Content Store Management jobs reference these definitions.

Name	Schedule	Time Zone	Enabled	Next Run	Actions
1	Every Night 10PM * * * * *	Asia/Bangkok	☒	Disabled	View Edit Delete
10	Every Night 10PM * * * * *	Asia/Bangkok	☒	Disabled	View Edit Delete
11	Every Night 10PM * * * * *	Asia/Bangkok	☒	Disabled	View Edit Delete
12	Every Night 10PM * * * * *	Asia/Bangkok	☒	Disabled	View Edit Delete
13	Every Night 10PM * * * * *	Asia/Bangkok	☒	Disabled	View Edit Delete
14	Every Night 10PM * * * * *	Asia/Bangkok	☒	Disabled	View Edit Delete
2	* * * * * * * * * *	Asia/Bangkok	☒	Disabled	View Edit Delete
3	* * * * * * * * * *	Asia/Bangkok	☒	Disabled	View Edit Delete

5	* * * * * * * * * *	Asia/Bangkok	☒	Disabled	View Edit Delete
10000	* * * * * * * * * *	Asia/Bangkok	☒	Disabled	View Edit Delete
6	* * * * * * * * * *	Asia/Bangkok	☒	Disabled	View Edit Delete
100	* * * * * * * * * *	Asia/Bangkok	☒	Disabled	View Edit Delete

Reusable schedule definitions

Repository storage selector action

Additional public work screens - Content Storage Scheduling and Selection.

These views supplement the preceding capability summary and show distinct parts of the delivered user experience.

02

SECURITY AND CONTENT GOVERNANCE

Document Security and Access Governance

Protected documents and governed enterprise actions through backend enforcement supported by clear user-facing controls.

MY ROLE	DELIVERY SCOPE	TECH HIGHLIGHTS
System Analyst / Technical Lead / Java Developer	Authorization, document protection and supporting Share UI	Java, Repository Security, Encryption, PDF/Office, JavaScript

WHY IT MATTERED Apply document protection, upload policy and role-based access consistently across repository services and the user interface.

02 Document Security and Access Governance

Backend-enforced authorization, content protection and upload policy with role-aware UI

Legend: blue = application component, teal = service, purple dashed = external system, green = data store, amber = event or file channel

High-level architecture overview - Document Security and Access Governance.

WHAT I DELIVERED

- Created repository-integrated encryption/decryption for PDF, Office and other binary content.
- Built configurable group-based controls for sites, repository areas, search, sharing and downloads.
- Added upload restrictions by extension, MIME type, size and image dimensions.
- Aligned menus, forms and document actions with the same policies enforced by backend services.

HOW IT HELPED

- Reduced the gap between what the interface hides and what the backend actually permits.
- Made protection and upload policies reusable across interactive actions and direct service requests.
- Improved security without presenting users with actions they could not complete.

3 projects represented: File Encryption, Access and Site Governance, and Advanced File Blocker.

MODERN TRANSLATION Spring Security-style authorization, policy enforcement, data protection and backend validation supported by role-aware UI.

03

SELECTED WORK SCREENS

Audit Investigation

A selected administration view for searchable repository activity.

WHAT THIS SHOWS The audit interface turns captured activity into a practical investigation surface for operations and support teams.

Additional public work screens - Audit Investigation.

These views supplement the preceding capability summary and show distinct parts of the delivered user experience.

04

DOCUMENT PRODUCTIVITY

Document Operations and Digital Capture

Brought bulk administration, PDF processing, scanning and OCR into governed repository workflows.

MY ROLE	DELIVERY SCOPE	TECH HIGHLIGHTS
System Analyst / Java Repository Developer	Document processing, capture services and admin tools	Java, PDFBox, OCR Integration, TIFF, CSV/XLSX, Share

WHY IT MATTERED Reduce manual desktop work and make document outputs immediately available as managed content with permissions and metadata.

04 Document Operations and Digital Capture

Governed PDF processing, scanning, OCR and bulk administration inside repository workflows

Legend: blue = application component, teal = service, purple dashed = external system, green = data store, amber = event or file channel

High-level architecture overview - Document Operations and Digital Capture.

WHAT I DELIVERED

- Implemented document-to-PDF conversion as a user action and automated repository rule.
- Created PDF operations for merging, splitting, inserting, deleting, applying backgrounds and protected downloads.
- Built a scanning workspace that loads scanner pages or existing documents, supports OCR results and saves managed content.
- Implemented validated bulk import/export for users, groups, memberships and folder permissions.

HOW IT HELPED

- Reduced download-process-upload steps and kept new outputs inside repository governance.
- Connected paper capture directly to content types, metadata and controlled destinations.
- Made high-volume administration repeatable and reviewable through result and current-state reports.

4 projects represented: Authority and Permission Importer, Convert to PDF, PDF Toolkit, and Scan and OCR Workspace.

MODERN TRANSLATION Document-processing services, governed file pipelines, OCR integration and validated bulk administration.

04

SELECTED WORK SCREENS

Document Processing and Capture

Selected views of PDF operations and the document scanning workspace.

WHAT THIS SHOWS These screens show how governed document actions and browser-based capture were integrated into the repository user experience.

SELECTED WORK SCREENS

Additional public work screens - Document Processing and Capture.

These views supplement the preceding capability summary and show distinct parts of the delivered user experience.

04

SELECTED WORK SCREENS

PDF Toolkit Actions

Additional document-menu views showing how PDF operations were exposed to users.

WHAT THIS SHOWS The actions are available from relevant document menus and cover controlled merge, insert, delete and split operations alongside existing repository controls.

SELECTED WORK SCREENS

Document Actions ▾

-  Become Owner
-  Rebuild Thumbnail
-  Merge PDF Document
-  Download With Watermark
-  Set as Confidential
-  Compare Documents
-  Deselect All

PDF merge entry point

-  Edit Properties with Viewer
-  Download
-  View In Browser

... More...

-  Show Audit Log
-  Manage Permissions
-  Compare Document with...
-  Download With Watermark
-  Document Scan
-  Set as Confidential
-  Merge PDF Document
-  Delete Pages
-  Insert Pages into PDF
-  Split PDF Document
-  Split PDF Document at Page

Merge PDF Document

Extended PDF action menu

Additional public work screens - PDF Toolkit Actions.

These views supplement the preceding capability summary and show distinct parts of the delivered user experience.

04

SELECTED WORK SCREENS

Document Scan Workflow

Additional views of repository entry points, source folders and the scanning workspace.

WHAT THIS SHOWS The workflow connects repository folders, document actions and a browser-based scanning workspace so captured pages and OCR results can return to managed content.

SELECTED WORK SCREENS

Scanning and OCR workspace

Scan-enabled repository folders

Document Scan menu action

Additional public work screens - Document Scan Workflow.

These views supplement the preceding capability summary and show distinct parts of the delivered user experience.

05

AI AND KNOWLEDGE ACCESS

Permission-Aware AI Repository Assistant

Connected authenticated repository users to an AI question-answering service while keeping source documents traceable and permission-aware.

MY ROLE	DELIVERY SCOPE	TECH HIGHLIGHTS
Java / Enterprise Integration Developer	AI service adapter, session context and document links	Java, HTTP/JSON, AI Service Integration, Repository Metadata

WHY IT MATTERED Help users find answers from enterprise content without moving repository identity and access decisions into the browser.

05 Permission-Aware AI Repository Assistant

AI-assisted content discovery with authenticated context and governed source references

Legend: blue = application component, teal = service, purple dashed = external system, green = data store, amber = event or file channel

High-level architecture overview - Permission-Aware AI Repository Assistant.

WHAT I DELIVERED

- Built a server-side bridge for questions, session continuity, timeouts and controlled downstream errors.
- Forwarded authenticated user and authority context to support permission-aware retrieval behavior.
- Formatted responses and resolved supported source references into repository document links.
- Created a node-information service that returns permitted metadata and rejects unauthorized access.

HOW IT HELPED

- Added an AI-assisted discovery experience without exposing provider endpoints or integration details to the UI.
- Kept answers connected to governed source documents where references were available.
- Demonstrated how a modern AI capability can be added behind an established enterprise security boundary.

1 project represented: AI-Assisted Repository Chat.

MODERN TRANSLATION Permission-aware AI/RAG gateway patterns with authenticated context, sessions and traceable source references.

05

SELECTED WORK SCREENS

Repository AI Assistant

A selected view of permission-aware question answering inside the content workspace.

WHAT THIS SHOWS The user experience keeps questions, answers and source links within the authenticated repository context.

SELECTED WORK SCREENS

Additional public work screens - Repository AI Assistant.

These views supplement the preceding capability summary and show distinct parts of the delivered user experience.

06

PARTNER EXPERIENCE AND INTEGRATION

External Portal and Workflow Access

Delivered a dedicated portal for external users and connected it to selected internal workflow applications through a controlled server-side boundary.

MY ROLE	DELIVERY SCOPE	TECH HIGHLIGHTS
System Analyst / Technical Lead / Integration Developer	Portal accounts, signed workflow access and supporting UI	PHP, CodeIgniter, Workflow Platform, REST, JavaScript, Bootstrap

WHY IT MATTERED Let partners use approved processes without exposing workflow administration, integration credentials or internal service locations.

06 External Portal and Workflow Access

Controlled partner access to selected workflows through a server-side integration boundary

Legend: blue = application component, teal = service, purple dashed = external system, green = data store, amber = event or file channel

High-level architecture overview - External Portal and Workflow Access.

WHAT I DELIVERED

- Analyzed the external-user journey, account roles and permitted workflow access.
- Implemented account registration/status APIs and authenticated portal-session behavior.
- Built workflow application discovery, signed navigation context and server-side integration helpers.
- Delivered bilingual Bootstrap/JavaScript dashboards and embedded approved workflow views.

HOW IT HELPED

- Created a clearer trust boundary between partner users and the internal workflow platform.
- Allowed workflow applications to evolve while the portal maintained a consistent user experience.
- Combined backend integration and focused frontend delivery in one end-to-end solution.

1 project represented: Enterprise Portal and Workflow Integration.

MODERN TRANSLATION Partner portal / backend-for-frontend patterns with server-side service integration and signed access context.

06

SELECTED WORK SCREENS

Partner Portal Experience

Selected views of external-user administration and workflow access.

WHAT THIS SHOWS The portal provides a dedicated partner experience while server-side services control identity, sessions and approved workflow navigation.

SELECTED WORK SCREENS

Additional public work screens - Partner Portal Experience.

These views supplement the preceding capability summary and show distinct parts of the delivered user experience.

07

FINANCIAL SERVICES

Digital Onboarding and Customer Consent

Designed and delivered backend journeys that coordinate onboarding, trusted identity, consent content and dependent enterprise services.

MY ROLE	DELIVERY SCOPE	TECH HIGHLIGHTS
Senior Analyst / Backend Engineer / Technical Lead	System analysis, service orchestration and delivery leadership	Java, Spring Boot, REST, JWT, Redis, Kafka, WebClient

WHY IT MATTERED Provide secure, traceable onboarding operations across channel APIs and multiple backend systems while keeping the channel contract consistent.

07 Digital Onboarding and Customer Consent

Secure service orchestration across identity, customer profile, consent content, cache and audit events

Legend: blue = application component, teal = service, purple dashed = external system, green = data store, amber = event or file channel

High-level architecture overview - Digital Onboarding and Customer Consent.

WHAT I DELIVERED

- Translated business requirements into service flows, integration boundaries and implementation plans.
- Implemented registration, update, cancellation and confirmation orchestration across dependent services.
- Built secure consent inquiry with token context, external-content adapters and Redis cache-aside behavior.
- Led design discussions, code review, troubleshooting, release preparation and cross-team coordination.

HOW IT HELPED

- Turned cross-system onboarding requirements into maintainable backend responsibilities and predictable API outcomes.
- Reduced repeated external consent calls while keeping a stable client-facing contract.
- Improved traceability and production readiness through audit events, error mapping and delivery controls.

4 projects represented: Digital Onboarding Platform, Benefits Onboarding Service, Customer Consent Service, and Onboarding Confirmation.

MODERN TRANSLATION Secure microservice orchestration, API contracts, cache-aside integration, events and trusted identity context.

08

FINANCIAL OPERATIONS

Reconciliation and Settlement Processing

Built controlled batch pipelines for secure file preparation, high-volume processing, mismatch classification and operational reporting.

MY ROLE	DELIVERY SCOPE	TECH HIGHLIGHTS
Backend / Batch Engineer	Batch APIs, secure files, data comparison and persistence	Java, Spring Boot, Async, SFTP, MongoDB, SQL, Redis, Kafka

WHY IT MATTERED Turn dated operational files into validated, reportable processing outcomes while controlling memory, concurrency and rerun behavior.

08 Reconciliation and Settlement Processing

Controlled file intake, streaming comparison, bounded persistence and operational status

High-level architecture overview - Reconciliation and Settlement Processing.

WHAT I DELIVERED

- Implemented asynchronous start/status control with explicit processing outcomes.
- Built secure file download, control-file validation and configurable preprocessing.
- Created reconciliation logic for missing, different and extra transactions with repair events.
- Implemented concurrent settlement mapping and bounded chunk persistence for high-volume files.

HOW IT HELPED

- Separated operational control from long-running work so batch state remained visible.
- Reduced memory pressure by streaming input and persisting bounded chunks.
- Made mismatches and failures actionable through classification, events and report data.

2 projects represented: Transaction Reconciliation Batch and Settlement File Processing Batch.

MODERN TRANSLATION Observable data-pipeline and batch-processing patterns using streaming input, bounded concurrency and chunked persistence.

09

SYSTEM ANALYSIS AND PRODUCT ENHANCEMENT

Enterprise Modernization and Delivery Leadership

Connected requirements, architecture, implementation and production support across integrations and business-system enhancements.

MY ROLE	DELIVERY SCOPE	TECH HIGHLIGHTS
System Analyst / Technical Lead / Java Developer	Requirements, backend changes, integration and release support	Java, Spring Boot, REST/SOAP, Oracle SQL, JavaScript, DevOps

WHY IT MATTERED Deliver practical improvements to existing enterprise systems while maintaining operational continuity and cross-team alignment.

09 Enterprise Modernization and Delivery Leadership

End-to-end ownership from requirements and architecture through release readiness and production support

Legend: blue = application component, teal = service, purple dashed = external system, green = data store, amber = event or file channel

High-level architecture overview - Enterprise Modernization and Delivery Leadership.

WHAT I DELIVERED

- Converted business requirements into application flows, service designs and actionable development work.
- Implemented backend, database and targeted UI enhancements across product, sales and personnel functions.
- Delivered enterprise integrations with consistent contracts, mapping, error handling and quality controls.
- Coordinated developers, analysts, QA, infrastructure and release stakeholders through production readiness.

HOW IT HELPED

- Reduced ambiguity between business expectations and implementation responsibilities.
- Introduced improvements without requiring disruptive replacement of operational systems.
- Demonstrated ownership from analysis and technical design through delivery and support.

3 projects represented: Enterprise Integration Delivery, Product Management System, and Sales and Personnel Management Enhancements.

MODERN TRANSLATION End-to-end technical ownership: requirements, architecture, implementation governance, release readiness and production support.
